**Yu I. Chernov : The Living Tundra (Studies in Polar Research)** before purchasing it in order to gage whether or not it would be worth my time, and all praised The Living Tundra (Studies in Polar Research):

This wide-ranging account of the life of the tundra provides a fascinating insight into the ways in which animals, plants and climate interact in an inhospitable environment. Although the tundra is not rich in species compared with

habitats in the tropics or even in temperate regions, it is an area of great interest to ecologists, botanists and zoologists alike, as an excellent example of nature contending with extreme environmental stress. As a biogeographer and ecologist the author has used his firsthand experience of the Eurasian Sub-Arctic to present an overview of life on the tundra of the Soviet Northlands that has become a classic of ecological literature. The tradition of interdisciplinary studies is very strong among Soviet tundra scientists. This important book is a valuable guide to the life of the tundra and will interest all those interested in the conservation of its flora and fauna.
